

REQUIREMENT ANALYSIS DOCUMENT

Requirement Specification

Vision

Monopoly is a board game that represents business mans and property deeds. Required players are minimum 2, maximum 6. Player are moving by tossing the dices. The main object of players is buying the precious properties or enterprises and collect the Money from players that came these properties. Bankrupted players are disqualified. The last player is the winner.

Scope

Monopoly game will provide

40 square that include properties, enterprises, transportation foundations, community chests, chances, jail, visit, taxes, and park.

At very beginning a certain amount of Money is given to the players.

Players are moving by tossing dices. If the square that player comes in is a purchasable item, player can buy it if enough Money exists. The turn is remains for the same player if the dice is doubled. If the double actions happens three times player goes jail.

There are also not purchasable squares such as jail, chance, community chest and etc.

Players pay rent to the owner of the currently moved properties.

Players are paid for each pass-over of start point.

When players endangered of being bankrupted, they can get Money by selling the properties as hypothec.

There is no property swap between players.

When the player that can not get money anymore, namely, there is nothing to avoid bankruptcy, player is disqualified.

The game will remain until the last player stands or the iteration count is equals max iteration of game. In this situation wealthiest player is winner.

System constraints

GUI part is not included the game. The required displacements are made in console. To run the application JDK should be installed. No more plug-ins, softwares.
